

Pulse height spectra with fitted data

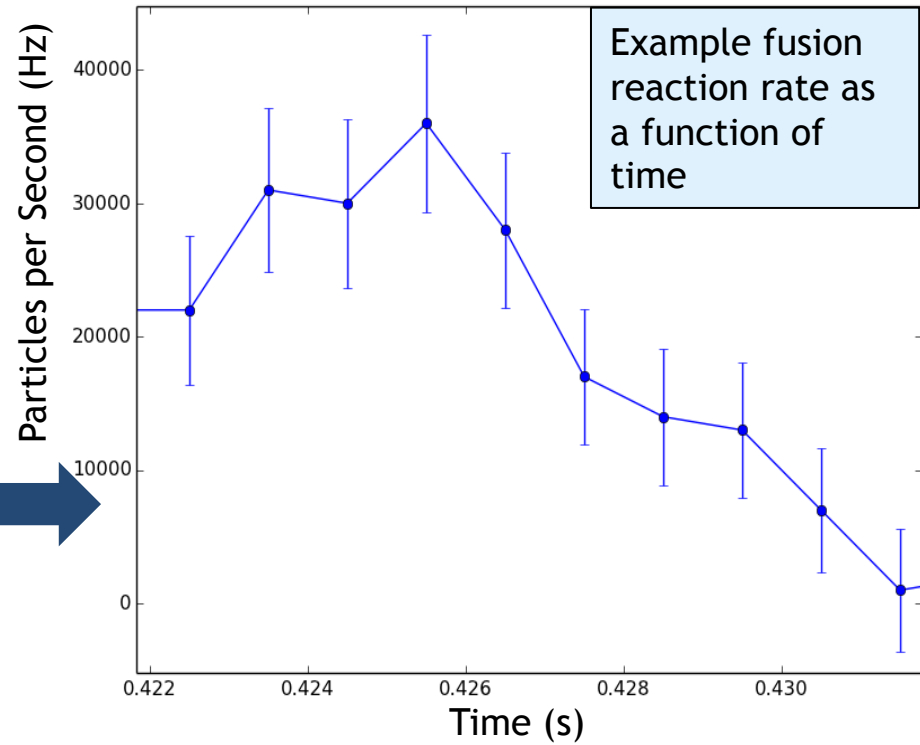

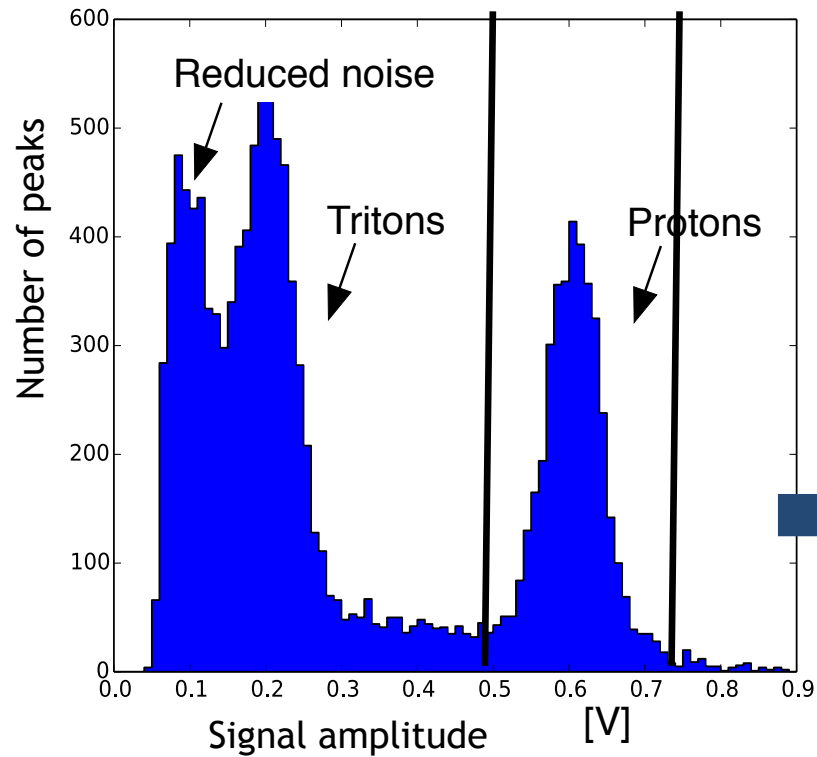

- Now use figure of merit, CR, to suppress noise and low energy signals

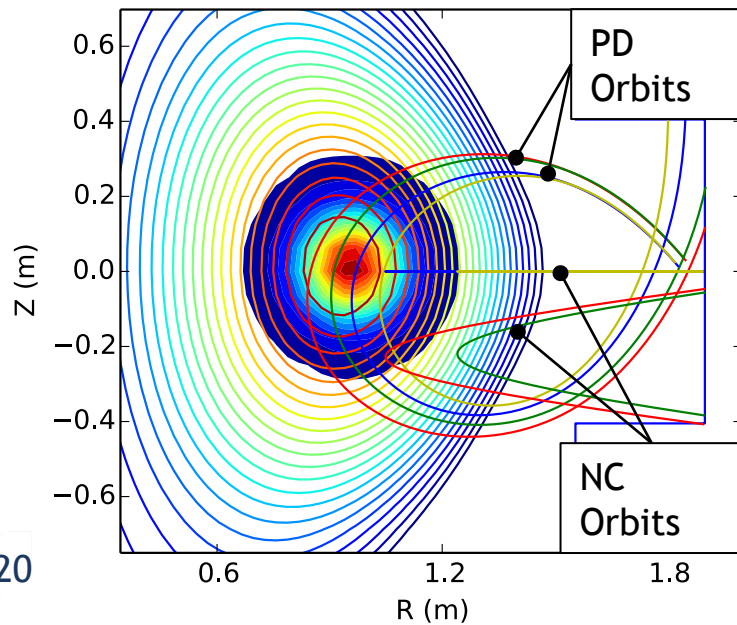

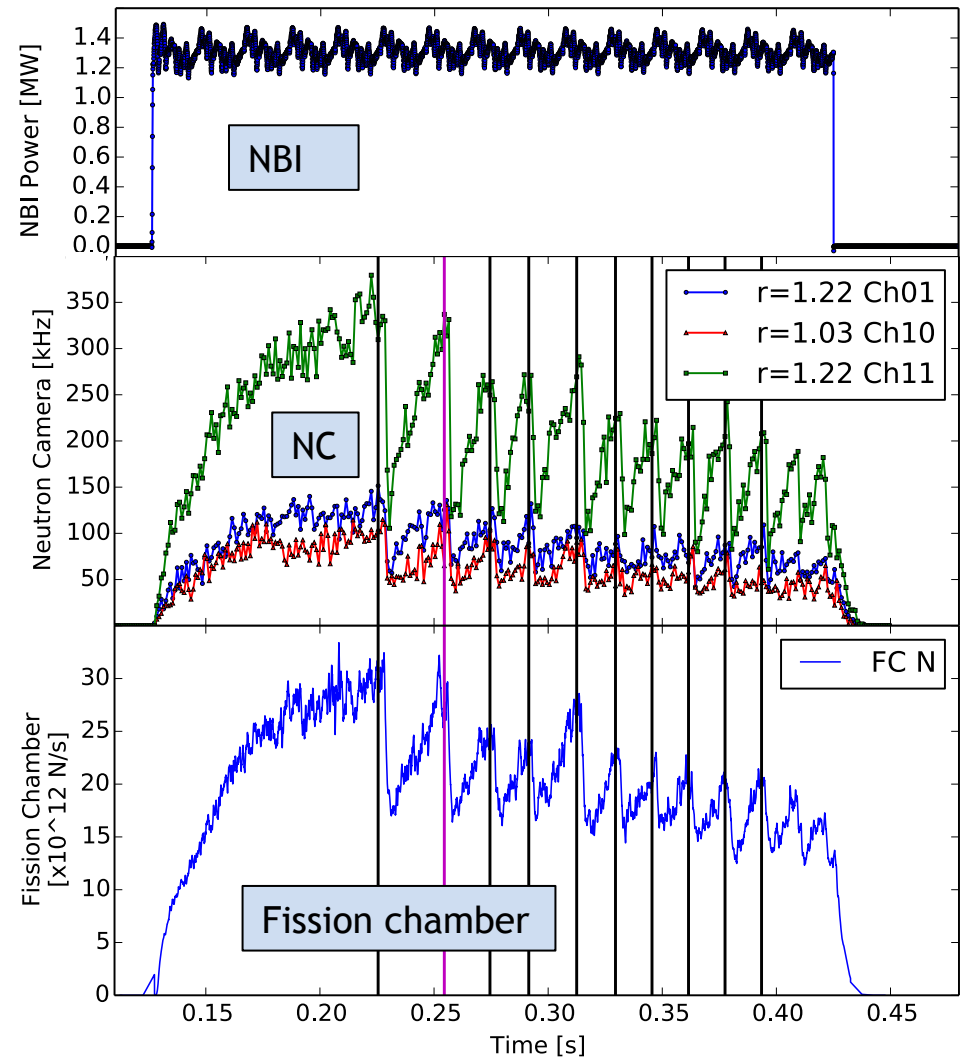

Pulse height spectra with further criteria

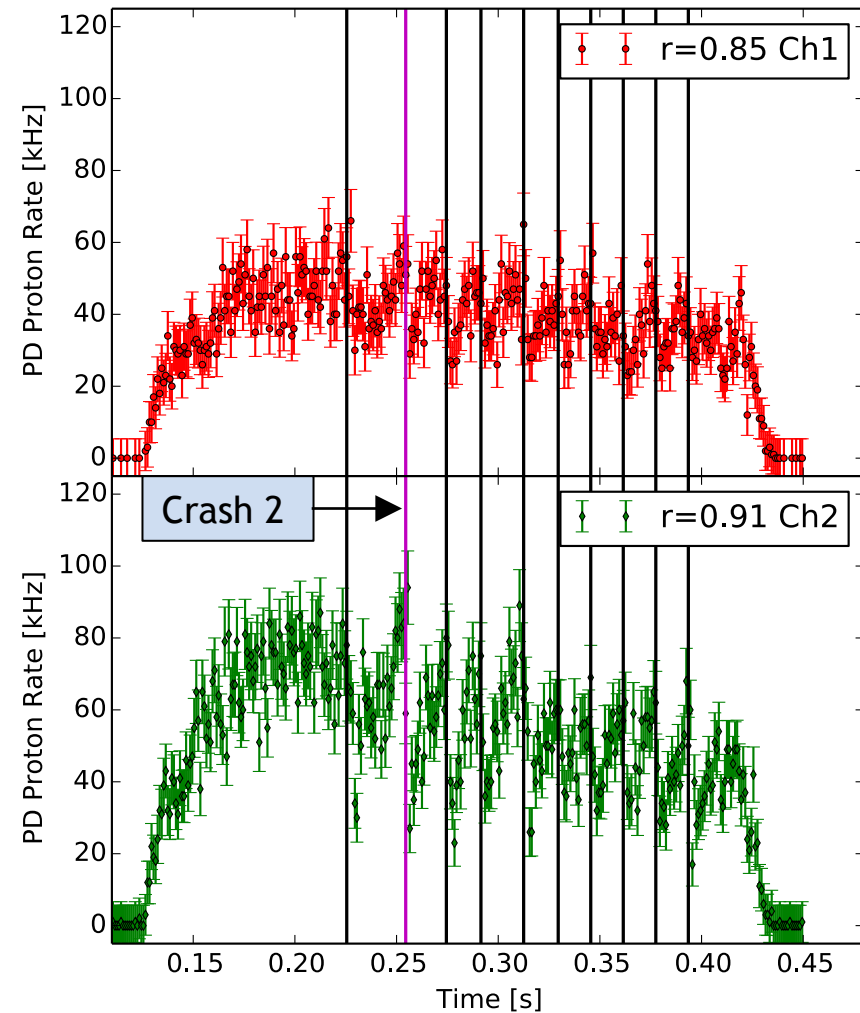

Proton Production Rates

Sawtooth crashes in complementary diagnostics

Sawtooth crash effects on proton emission

little change in radial positions calculated from EFIT reconstructions before and after the crash

Proton radial profile before and after crash 2

Emission profile model function
(simple gaussian):

$$S_g(r, z) = A e^{-\frac{((r-r_0)^2 + z^2)}{\sigma^2}}$$

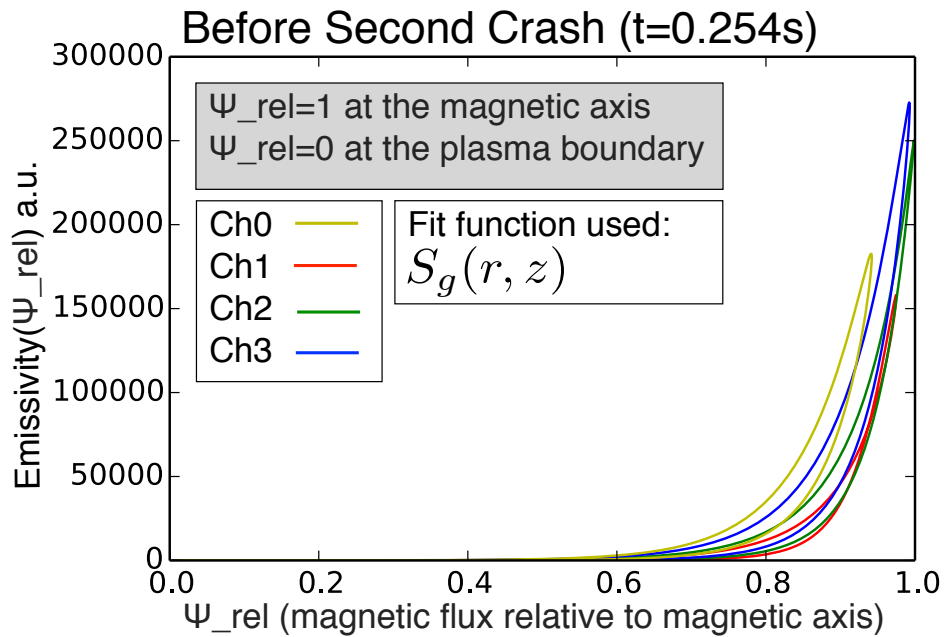

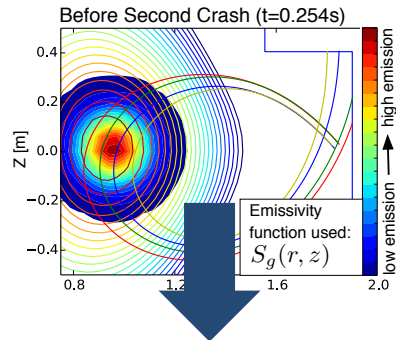

- r, z : position in the R-Z plane
(with with respect to magnetic axis)
- A, σ, r_0 : fit parameters
- arbitrary units

Proton emissivity (r, z) before and after crash 2

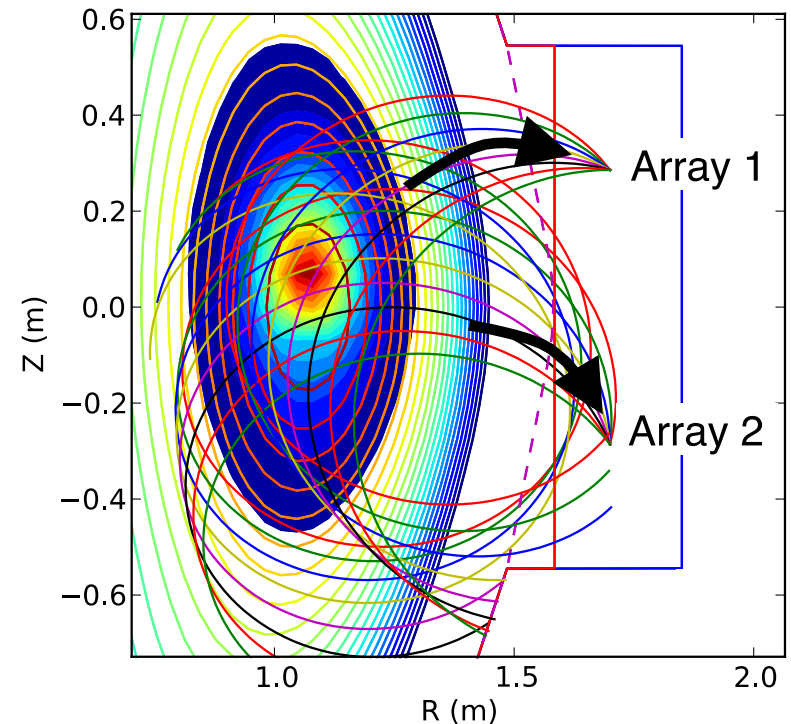

Proton emissivity as a function of ψ_{rel}

Summary: Proof of concept diagnostic

- First direct measurements of 3MeV protons in a spherical tokamak
- Advantages: size and cost
- Similar and complementary information to NC
- Combined analysis with NC for more detailed emission profile
- More advanced analysis needed to fit the triton emissivity

Future Work

- Design and build 16-channel system for NSTX-U, MAST-U (same size or smaller)
- Implement techniques for mitigating noise

Thank you for your time!
